

Introducing Enhancements to the award-winning Sygno-fi Range

We're proud to announce a series of powerful new upgrades to the wireless Sygno-fi product line - developed to speed up installation, streamline operations, and enhance system intelligence.

These improvements are designed to minimise complexity, improve workflow efficiency, and help you focus on what truly matters.

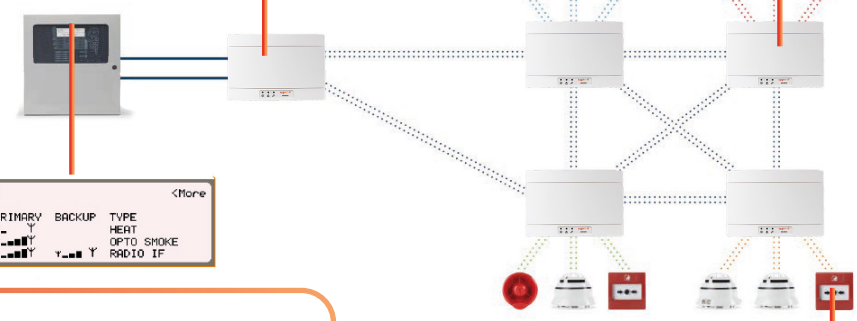

From simplified setups to smarter diagnostics, every element of Sygno-fi has been refined for optimal ease of use - whether you're handling an install or maintaining an existing system.

sygNEX Software

Link devices remotely: A newly introduced remote wake-up feature allows you to reassign a device to a different translator or expander without having to physically access it.

Sygno-fi Expanders

Automatic configuration: Expanders now enter Discovery Mode as soon as they are powered on. Once your system has been surveyed and pre-programmed, no additional steps are required, allowing for a faster and smoother setup process.

The diagram illustrates the Sygno-fi system architecture. On the left, a control panel is connected via a blue line to a central expander unit. This expander unit is then connected via dotted lines to a network of four additional expander units arranged in a square. Each of these four expanders is further connected to multiple Sygno-fi devices, represented by small icons with red and blue lights. The connections are shown as a mesh, indicating a complex, multi-point network topology.

Control Panels

Instant signal visibility: Signal strength can now be viewed directly from any second-generation MxPro5 control panel, making diagnostics faster and easier. This enables remote troubleshooting, eliminating the need for physical access to devices and minimising downtime.

Seamless Replacement Compatibility

All new Sygno-fi components are fully backward compatible, allowing you to replace older infrastructure or field devices with the latest versions without issue. However, please note that advanced features like remote wake-up and auto link setup are only available with the latest models.

Sygno-fi Devices

Hassle-free start-up: Devices automatically enter wake-up mode on power-up, making the addition of new devices incredibly straightforward.
